The Amplitude pro™ series

Amplitude pro one

For individual clinicians

Using pro one™, individual clinicians can capture PROMs data for all their patients, no matter where they are treated and how they are funded. Reporting is simple with the ability to interrogate data and track outcomes as well as generate revalidation reports.

Amplitude pro enterprise

For Units, Departments and Hospitals

pro enterprise™ allows groups of clinicians to collect and monitor outcomes within their organisation. This enables individual patient monitoring as well as evidencing the quality of care being delivered. Registry datasets are integrated into the platform. Data is entered just once and then sent electronically to relevant stakeholders, whilst still being retained by the organisation for local reporting and analysis.

Amplitude pro registry™

For Registries and Specialist Societies

Through pro registry™ Registries and Specialist Societies are able to focus on specific diseases, diagnosis, treatments and interventions and gain access to data in volumes never before possible. Reporting allows tracking of outcomes per indication and treatment type as well as allowing members/ contributors to monitor their outcomes against the pool of colleagues.

About Amplitude

Amplitude Clinical Outcomes is a globally recognised supplier of software systems that capture and report clinical and patient reported outcomes data (PROMs).

Amplitude supplies electronic PROMs to the NHS and private healthcare sectors in the UK and South Africa. Each system is highly customisable, and the vast amount of pre-loaded clinical data allows clinicians to track the progress of patients, picking up deviations from expected recovery and any post intervention complications.

The Amplitude platform gives patients the freedom to complete scores online, and the clinicians' dashboard gives healthcare professionals the ability to quickly input treatment and patient specific data. The data is then retained locally and is available in real-time for reporting and analysis.

clinical outcomes

Leading UK Patient Reported (PROMs) and Clinical Outcomes platform

Clinical Outcomes for any Environment

The Amplitude pro™ series allows clinicians and healthcare professionals to easily collect clinical outcomes using high spec'd web-based technology. The solution enables easy monitoring, tracking and reporting of outcomes at both an individual patient level, where data can be used to support clinical decision making, or at a consolidated level to evidence the quality of care being delivered within a unit or across an organisation.

Data is entered just once and sub-sets are sent electronically to relevant stakeholders using the unique Data Exchange tool developed by Amplitude. This means data can be shared with a range of stakeholders including mandated and optional national registries, local and regional audits as well as with an organisation's EPR and data warehouse.

Data is retained and controlled in the source system, whilst ensuring compliance with required submissions.

How the Amplitude pro™ series works

1	Patient put on treatment pathway by their Doctor or his/her Clinical Team
2	Patient sent link to complete baseline scores at home or on arrival in clinic/office
3	Doctor completes the intervention/treatment form within the Amplitude system
4	Patient sent automated email and SMS prompts to complete all post-intervention scores from home at set intervals after intervention or on-going during treatment
5	Doctor able to easily monitor and review patient recovery and generate reports on outcomes as required

Data is available in near real-time, covering a full range of interventions including elective treatment, emergency and trauma treatments, as well as chronic illnesses including mental health conditions, and much more.

Amplitude uses clinical terminology and descriptions (not code book descriptions). Whilst minimal input is required by the clinician, there is the option to add complexity factors, comorbidities and other relevant information that informs the case mix. With accurate clinical descriptions and case mix adjustment, patient outcomes are viewed within the correct clinical context resulting in useful and meaningful reports.

The software supports multi-lingual data entry by patients as well as allows for electronic questionnaires to be completed on a variety of hardware from PCs to tablets and smartphones.

The system automates the data collection process sending email and SMS reminders and links to patients. Recording data is simple for clinical teams and, wherever possible, part of normal work routine, therefore minimising admin.

Amplitude gives you clinically valid data and keeps you in control.
